МИНИСТЕРСТВО ОБРАЗОВАНИЯ РЕСПУБЛИКИ БЕЛАРУСЬ БЕЛОРУССКИЙ ГОСУДАРСТВЕННЫЙ УНИВЕРСИТЕТ

Факультет прикладной математики и информатики

Лабораторная работа №3

РЕШЕНИЕ СИСТЕМ ЛИНЕЙНЫХ АЛГЕБРАИЧЕСКИХ УРАВНЕНИЙ МЕТОДОМ РЕЛАКСАЦИИ И МЕТОДОМ ПРОСТЫХ ИТЕРАЦИЙ

Преподаватель: Полевиков Виктор Кузьмич доцент кафедры вычислительной математики

Студент: Болтач Антон Юрьевич

2 курс 9 группа

Постановка задачи

- 1) Построить стандартную программу решения систем линейных алгебраических уравнений методом протой итерации и релаксации.
- 2) Рассмотрим СЛАУ вида:

A*x = f

Задана матрица А с строгим диагональным преобладанием размером 20х20:

Матрица А:

90.6

Краткая теория и алгоритм решения

Рассмотрим систему линейных алгебраических уравнений $\mathbf{A}\mathbf{x} = \mathbf{f}$. Пусть \mathbf{A} — квадратная матрица со строгим преобладанием главной диагонали.

Для предложенной системы необходимо:

- 1) Построить сходящийся алгоритм метода простых итераций и найти решение с точностью $\varepsilon = 10^{-7}$. Определить количество выполненных итераций k_{ε} .
- 2) Построить сходящийся алгоритм метода релаксации и найти решение с точностью $\varepsilon = 10^{-7}$ для следующих значений параметра q: 0.1; 0.2; ...; 1.8; 1.9.
- 3) Определить отрезок $[q_i; q_{i+1}]$, на котором алгоритм метода релаксации сходится наиболее быстро, и уточнить на нем q_{opt} .
- 4) Привести решение при q=1 и построить график $k_{\varepsilon}(q)$.

Метод простых итераций:

Для реализации алгоритма $M\Pi U$ выполним задачу по приведению данной системы к каноническому виду: $\mathbf{x}^{k+1} = \mathbf{B}\mathbf{x}^k + \mathbf{g}$, где (k = 0, 1, 2...). Критерий сходимости имеет вид: $\boldsymbol{\rho}(\boldsymbol{B}) < 1$, где $\boldsymbol{\rho}$ - вектор собственных значений матрицы. Пусть $\boldsymbol{A} = \boldsymbol{A}^T > \mathbf{0}$, тогда справедливы следующие формулы:

$$B = E - \frac{A}{\|A\|}, \ \ g = \frac{f}{\|A\|}.$$

При любом значении вектора начального приближения x^0 алгоритм продолжает свою работу, пока не выполнено условие: $||x^{k+1} - x^k|| \le \varepsilon$.

Априорную оценку необходимого числа итераций для заданного ε можно выполнить при условии, что $\|\boldsymbol{B}\| < 1$, с помощью формулы:

$$oldsymbol{k}_{oldsymbol{arepsilon}} = \left| oldsymbol{\log_{\|B\|}} rac{oldsymbol{arepsilon}(\mathbf{1} - \|B\|)}{\|g\|}
ight|$$

Метод релаксации(при q = 1, метод Зейделя):

Пусть $A = A^T > 0$, тогда матрица **B** и вектор **g** строятся следующим образом:

$$b_{ii} = 0, \ b_{ij} = \frac{-a_{ij}}{a_{ii}} \ (i \neq j), \ g_i = \frac{f_i}{a_{ii}}; \ \forall i = \overline{1, n}.$$

Для построения алгоритма необходимо представить матрицу **B** в виде суммы нижнетреугольной матрицы **L** и верхнетреугольной матрицы **F**. Тогда при любом значении вектора начального приближения x^0 алгоритм имеет вид:

$$x^{k+1} = (1-q)x^k + q\big[Lx^{k+1} + Rx^k + g\big], k = 0, 1, \dots \ , \ \forall q \in (0;2).$$

Построенный алгоритм сходится при 0 < q < 2 и продолжает работу до тех пор, пока не будет выполнено условие:

$$\frac{\left\|x^{k+1}-x^k\right\|}{q}\leq \varepsilon.$$
